Sealed Subminiature Basic Switch Conforming to IP67 (Excluding the terminals on terminal models)

- Use of epoxy resin assures stable sealing, making this switch ideal for places subject to water spray or excessive dust.
- Ideal for automobiles, automatic vending machines, refrigerators, ice-making equipment, bath equipment, hot-water supply systems, air conditioners, and industrial equipments, which require high environmental resistance.
- Models available with UL, cUL, and VDE safety standard compliance.

RoHS Compliant

Model Number Legend

1. Ratings
   - 3 : 125 VAC  3 A
   - 01 : 30 VDC  0.1 A

2. Actuator
   - None : Pin plunger
   - L1 : Hinge lever
   - L2 : Hinge roller lever
   - L3 : Simulated roller hinge lever

3. Contact form
   - None : SPDT
   - -2 : SPST-NC (Molded lead wire models only)
   - -3 : SPST-NO (Molded lead wire models only)

4. Terminals
   - H, HS : Solder terminals
   - D, DS : Self-clinching PCB terminals
   - T, TS : Quick-connect terminals (#110)
   - M, MS : Molded lead wires
   - Note: UL/cUL approved versions are available. In this case, HS, DS, TS, MS will be added to the end of the model number.
   - UL/cUL approved models have UL approved wiring (AWG22 UL1015).
   - Consult your OMRON sales representative for details.

5. Length of the molded lead wire
   - None : 300 mm
   - -0 : 1,000 mm

Precautions

★Please refer to “Basic Switches Common Precautions” for correct use.

<table>
<thead>
<tr>
<th>Cautions</th>
<th>Correct Use</th>
</tr>
</thead>
</table>

● **Degree of Protection**

Do not use the Switch underwater.

The Switch was tested and found to meet the conditions necessary to meet the following standard, however, the test checks for water intrusion after immersion for a specified time period, not for switching operation underwater.

JIS C0920:
- Degrees of protection provided by enclosures of electrical apparatus (IP Code)
- IEC 60529:
- Degrees of protection provided by enclosures (IP Code)
- Degree of protection: IP67
  - (check water intrusion after immersion for 30 min submerged 1 m underwater)

● **Protection Against Chemicals**

Prevent the Switch from coming into contact with oil or chemicals.

Otherwise, damage to or deterioration of Switch materials may result.

● **Soldering**

- **Connecting to Solder Terminals**
  - When soldering the lead wire to the terminal, first insert the lead wire conductor through the terminal hole and then conduct soldering.
  - Complete the soldering at the iron tip temperature between 350 to 400°C within 5 seconds, and do not apply any external force for 1 minute after soldering. Soldering at excessively high temperature or soldering for more than 5 seconds may deteriorate the characteristics of the Switch.
  - **Connecting to Quick-connect Terminals**
    - Wire the quick-connect terminals (#110) with receptacles. Insert the terminals straight into the receptacles. Applying excessive external force laterally may cause deformation of terminals and may damage the housings.
  - **Connecting to PCB terminals**
    - When using automatic soldering baths, we recommend soldering at 260±5°C within 5 seconds. Make sure that the liquid surface of the solder does not flow over the edge of the board.
    - When soldering terminals manually, complete the soldering at the iron tip temperature between 350 to 400°C within 5 seconds, and do not apply any external force for 1 minute after soldering. When applying solder, keep the solder away from the case of the Switch and do not allow solder or flux to flow into the case.

● **Mounting**

Use M2.3 mounting screw with plane washers or spring washers to securely mount the Switch. Tighten the screws to a torque of 0.23 to 0.26 N·m (2.3 to 2.7 kgf-cm).

● **Operating Body**

With the pin plunger models, set the Switch so that the plunger can be pushed in from directly above. Since the plunger is covered with a rubber cap, applying a force from lateral directions may cause damage to the plunger or reduction in the sealing capability.

● **Handling**

Handle the Switch carefully so as not to break the sealing rubber.

● **Using Micro Loads**

Using a model for ordinary loads to open or close the contact of a micro load circuit may result in faulty contact. Use models that operate in the following range. However, even when using micro load models within the following operating range, if inrush current occurs when the contact is opened or closed, it may increase the contact wear and so decrease durability. Therefore, insert a contact protection circuit where necessary. The N-level reference value applies for the minimum applicable load. This value indicates the malfunction reference level for the reliability level of 60% ($\lambda_{60}$).

(JIS C5003)

The equation, $\lambda_{60}=0.5\times10^{-6}$/operations indicates that the estimated malfunction rate is less than $\frac{1}{2,000,000}$ operations with a reliability level of 60%.
